# Weather Station Over MQTT

# Requirements

- Hardware Components
- DHTII (for temperature & humidity)
- · ESP8266 (NodeMCU) (for WiFi & MQTT)
- Jumper Wires (for connections)
- Software
- · Arduino IDE (with ESP8266 & DHT sensor libraries)
- · Mosquitto MQTT Broker (We have a VPS at 157.173.101.159)
- · WiFi Connection

```
// Function to Connect to WiFi
21
    void setup_wifi() {
22
        Serial.print("Connecting to WiFi...");
23
24
        WiFi.begin(ssid, password);
        while (WiFi.status() != WL_CONNECTED) {
25
26
            delay(500);
            Serial.print(".");
27
28
        Serial.println("\nConnected to WiFi!");
29
30
```

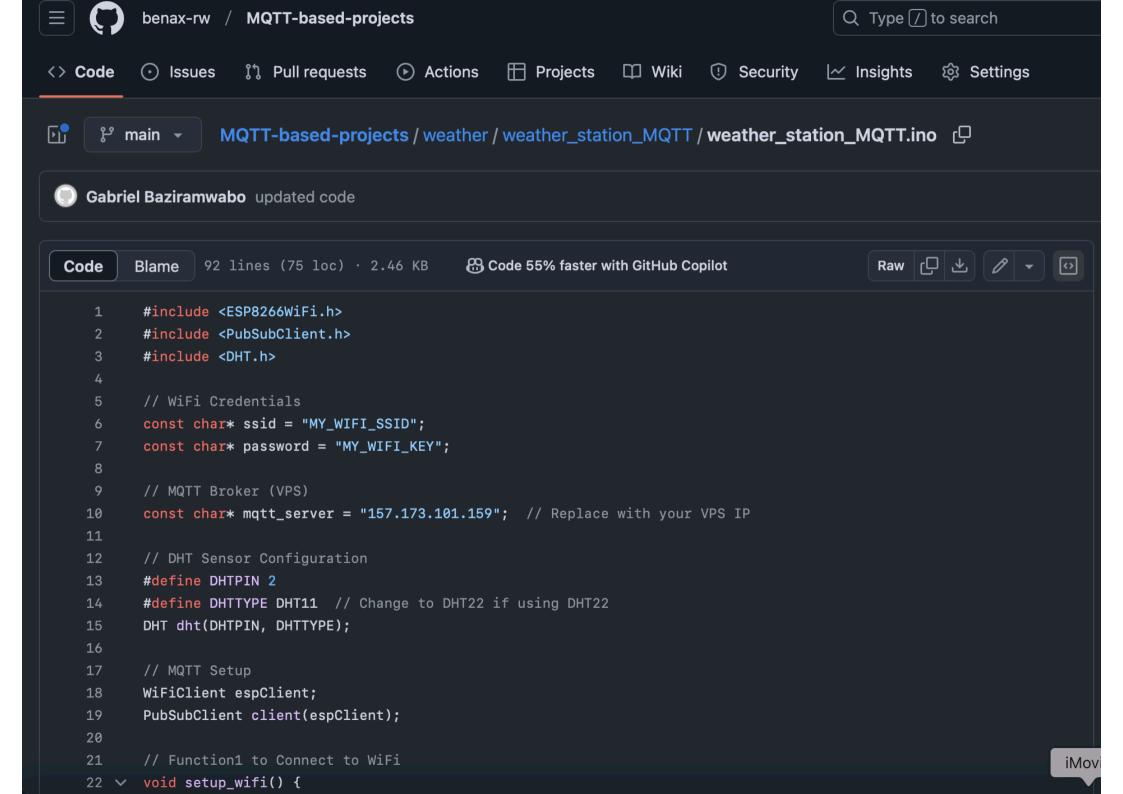

```
// Function to Connect to MQTT Broker
32
    void reconnect_mqtt() {
33
        while (!client.connected()) {
34
             Serial.print("Connecting to MQTT...");
35
             if (client.connect("ESP8266")) {
36
                 Serial.println("Connected to MQTT!");
37
38
             } else {
                 Serial.print("Failed, retrying in 5 seconds...");
39
                 delay(5000);
40
41
42
43
```

```
45
    // Function to Read Sensor Data
46
    void read_sensor(float &temperature, float &humidity) {
        temperature = dht.readTemperature();
47
        humidity = dht.readHumidity();
48
49
50
        if (isnan(temperature) || isnan(humidity)) {
            Serial.println("Failed to read from DHT sensor!");
51
            temperature = -1; // Invalid value
52
            humidity = -1; // Invalid value
53
54
55
```

```
void publish_sensor_data(float temperature, float humidity) {
58
        if (temperature == -1 || humidity == -1) {
59
60
            return; // Do not publish invalid values
61
62
63
        String temp_payload = String(temperature);
        String hum_payload = String(humidity);
64
65
        client.publish("/work_group_01/room_temp/temperature", temp_payload.c_str());
66
        client.publish("/work group 01/room temp/humidity", hum payload.c str());
67
68
        Serial.println("Published: Temperature = " + temp_payload + "°C");
69
        Serial.println("Published: Humidity = " + hum_payload + "%");
70
71
```

#### Code | setup() and loop(), native functions of the Arduino Framework

```
void setup() {  //run once at the beginning
73
        Serial.begin(115200);
74
        setup_wifi(); //call Function1
75
76
        client.setServer(mqtt_server, 1883);
        dht.begin();
77
78
79
80
    void loop() { //run forever
        if (!client.connected()) {
81
82
            reconnect_mqtt(); //call Function2
83
84
        client.loop();
85
86
        float temperature, humidity;
87
        read_sensor(temperature, humidity); //call Function3
        publish_sensor_data(temperature, humidity); //call Function4
88
89
        delay(5000); // Send data every 5 seconds
90
91
```

# Viewing real-time sensor data from MQTT

```
gabriel@MacBookAir-2 ~ % mosquitto_sub -h 157.173.101.159 -t "/work_group_01/room_temp/#" -v
/work_group_01/room_temp/temperature 25.80
/work_group_01/room_temp/humidity 60.00
```

Installing Mosquitto (Depends on Your OS)

#### ★ On Linux (Ubuntu/Debian)

sh

sudo apt update
sudo apt install -y mosquitto mosquitto-clients

#### ★ On macOS (Homebrew)

sh

brew install mosquitto

♦ After installing, start Mosquitto as a background service:

sh

brew services start mosquitto

#### **★** On Windows

- 1 Download Mosquitto from the official website:
- https://mosquitto.org/download/
- 2 Install it and ensure the mosquitto binaries are in your system path.
